

Project Demo Planning

Date	04 July 2026
Team ID	
Project Name	Credit Card Approval Prediction
Maximum Marks	1 Mark

Project Demo Planning:

This plan outlines the demo for the Credit Card Approval Prediction System — a machine learning web application that predicts credit card approval or rejection using historical applicant data, feature engineering, and a Flask interface deployed via IBM Watson Machine Learning.

S.No	Demo Section	Description	Duration (mins)	Responsible Member
1	Introduction & Problem Statement	Explain how banks manually screen thousands of credit card applications, why this is slow and error-prone, and how ML-based automation solves it.	1 min	B.Supraja Chowdary
2	Dataset Overview & EDA	Walk through the credit card approval dataset (gender, income type, annual income, employment duration, education) and show count plots / distribution plots from the EDA.	1 min	K. Akhil Kumar reddy
3	Data Preprocessing & Feature Engineering	Demonstrate handling of missing values, duplicate removal, categorical encoding, and conversion of payment status into binary risk labels.	30 sec	M.. Thanoj
4	Model Building & Evaluation	Show training and comparison of Logistic Regression, Decision Tree, Random Forest, and XGBoost using accuracy, confusion matrix, and classification report; highlight the best model selected.	1 min	M.. Thanoj
5	Flask Web App – Live Demonstration	Live walkthrough of the web app: entering applicant details (income, employment, credit history) and instantly getting an approval/rejection prediction, covering the analyst, compliance, and self-service customer scenarios.	20 sec	K. Akhil Kumar reddy
6	Cloud Deployment & Closing	Show the IBM Watson Machine Learning deployment pipeline enabling scalable, real-time predictions in the cloud, then summarize outcomes and open the floor for questions.	1 min	B.Supraja Chowdary

Demo Flow Summary:

Step	Activity	Notes
1	Introduction & Problem Statement	Set the context: manual credit card screening is slow and error-prone; ML can automate approve/reject decisions.
2	Solution Overview	Data pipeline (EDA → preprocessing → feature engineering) feeding four classifiers, best model deployed via Flask + IBM Watson ML.
3	Live Feature Demonstration	Run the three scenarios: analyst screening, compliance batch review of high-risk applicants, and self-service eligibility check.
4	Q&A Session	Address audience questions on model choice, data handling, and cloud deployment.
