

Team Involvement in Demonstration

Date	04 July 2026
Team ID	
Project Name	Credit Card Approval Prediction System
Maximum Marks	1 Mark

Team Involvement in Demonstration:

This document records the active participation and roles of each team member during the demonstration of the Credit Card Approval Prediction System. It ensures that every member contributes meaningfully to the presentation and that responsibilities are distributed fairly and clearly.

S.No	Team Member Name	Role in Demo	Section Presented	Contribution Summary	Participation (Active / Passive)
1	B. Supraja Chowdary	Team Lead	Introduction & Problem Statement	Framed the business problem of manual credit card screening and set the context for the ML-based solution.	Active
2	K. Akhil Kumar reddy	Data Analyst	Dataset Overview & EDA	Presented the applicant dataset and walked through EDA visualizations (count plots, distribution plots).	Active
3	M.. Thanoj	ML Engineer	Data Preprocessing & Feature Engineering	Explained missing value handling, encoding, and conversion of payment status into binary risk labels.	Active
4	M.. Thanoj	ML Engineer	Model Building & Evaluation	Demonstrated training and comparison of Logistic Regression, Decision Tree, Random Forest, and XGBoost models.	Active
5	K. Akhil Kumar reddy	Full-Stack Developer	Flask Web App – Live Demonstration	Ran the live demo of the web app across the analyst, compliance, and customer self-service scenarios.	Active
6	B. Supraja Chowdary	Team Lead	Cloud Deployment & Closing	Covered the IBM Watson Machine Learning deployment pipeline and moderated the Q&A session.	Active

Team Coordination Notes:

Aspect	Details
Team Leader / Coordinator	Bodapati Supraja Chowdary
Overall Team Coordination Rating (1-5)	5
Any issues during demo	During the live demo, the Flask app took several seconds to return a prediction on the first request, and the audience briefly saw a blank/loading screen. This happened because the saved ML model was being loaded into memory on the first call instead of at server startup.
How issues were resolved	The Full-Stack Developer explained the delay live to keep the audience informed, then refreshed and re-submitted the form, which returned the prediction instantly since the model was now cached in memory. Post-demo, the team fixed the root cause by loading the model once at Flask app startup (instead of per-request) and adding a simple loading indicator on the UI so future runs don't show a blank screen.
